##  
## i Use 'spec()' to retrieve the full column specification for this data.  
## i Specify the column types or set 'show_col_types = FALSE' to quiet this message.
```

```
pkm=clean_names(pkm)  
pkm=filter(pkm,type_1 %in% c("Bug","Fire","Grass","Normal","Water","Psychic"))  
pkm$type_1=as.factor(pkm$type_1)  
pkm$legendary=as.factor(pkm$legendary)  
pkm$generation=as.factor(pkm$generation)  
set.seed(1234)  
pkm_split=initial_split(pkm,prop=0.70,strata=type_1)  
train=training(pkm_split)  
test=testing(pkm_split)  
folds=vfold_cv(train,v=5,strata=type_1)  
rcp=recipe(type_1~legendary+generation+sp_atk+attack+speed+defense+hp+sp_def,data=train) %>%  
  step_dummy(legendary) %>%  
  step_dummy(generation) %>%  
  step_normalize(all_predictors())
```

Question2

```
pkm %>%
  dplyr::select(where(is.numeric)) %>%
  cor() %>%
  corplot(method='number', type='lower')
```

I choose to include all the numeric/continuous variables in this plot. We observe a strong correlation between total with other variables, which make sense because total is the sum of all stats. Also, we don't see any negative correlation, maybe because all the stats of a Pokemon tend to grow together.

Question3

```
tree_spec=decision_tree() %>%
  set_engine("rpart")
class_tree_spec=tree_spec %>%
  set_mode("classification")
class_tree_wf=workflow() %>%
  add_model(class_tree_spec %>%
    set_args(cost_complexity = tune())) %>%
  add_recipe(rcp)

grid=grid_regular(cost_complexity(range = c(-3, -1)), levels = 10)

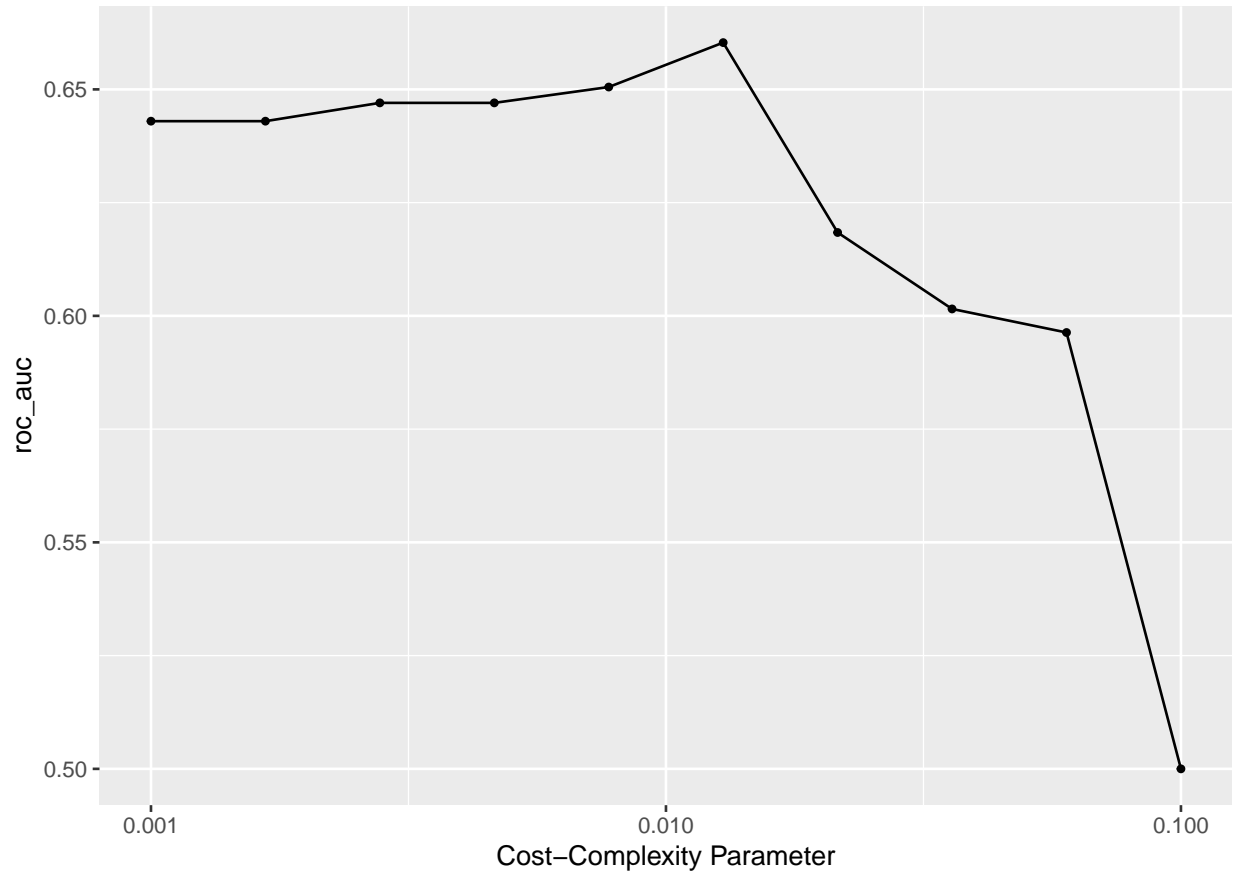

tune_res=tune_grid(
  class_tree_wf,
  resamples=folds,
  grid=grid,
```

```

    metrics=metric_set(roc_auc)
  )

autoplot(tune_res)

```

We observe that a single decision tree perform better with a smaller complexity penalty overall, but it perform best on the middle range.

Question4

```

collect_metrics(tune_res) %>%
  arrange(-mean)

```

```

## # A tibble: 10 x 7
##   cost_complexity .metric .estimator mean      n std_err .config
##           <dbl> <chr>   <chr>   <dbl> <int>   <dbl> <chr>
## 1      0.0129 roc_auc hand_till 0.660     5 0.0141 Preprocessor1_Model06
## 2      0.00774 roc_auc hand_till 0.651     5 0.0163 Preprocessor1_Model05
## 3      0.00278 roc_auc hand_till 0.647     5 0.0186 Preprocessor1_Model03
## 4      0.00464 roc_auc hand_till 0.647     5 0.0186 Preprocessor1_Model04
## 5      0.001   roc_auc hand_till 0.643     5 0.0183 Preprocessor1_Model01
## 6      0.00167 roc_auc hand_till 0.643     5 0.0183 Preprocessor1_Model02
## 7      0.0215  roc_auc hand_till 0.618     5 0.00683 Preprocessor1_Model07
## 8      0.0359  roc_auc hand_till 0.602     5 0.0132 Preprocessor1_Model08
## 9      0.0599  roc_auc hand_till 0.596     5 0.0146 Preprocessor1_Model09
## 10     0.1     roc_auc hand_till 0.5       5 0       Preprocessor1_Model10

```

The roc\_auc of our best-performing pruned decision tree on the folds is 0.66 in model 06.

Question5

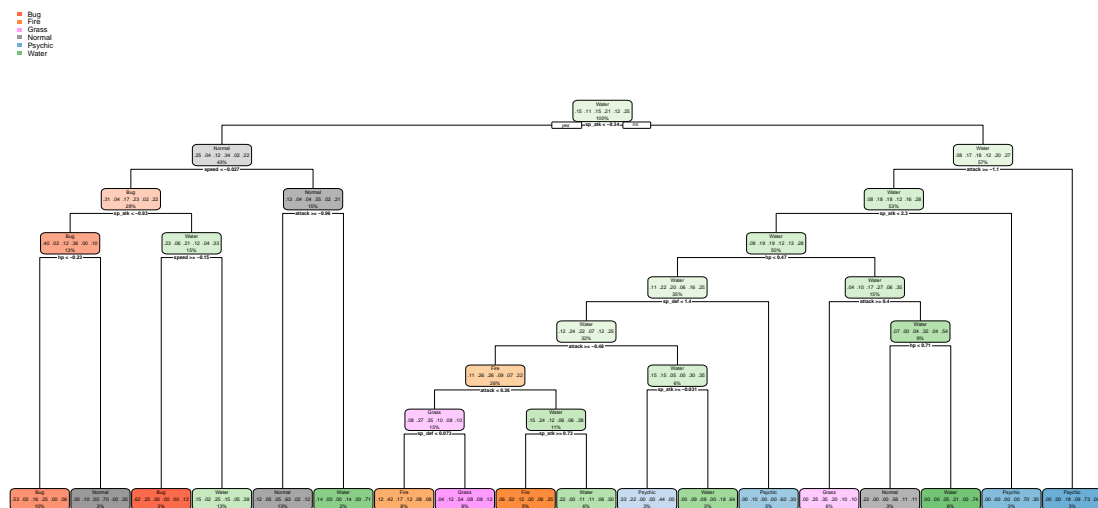

```
best=select_best(tune_res)

final=finalize_workflow(class_tree_wf,best)

final_fit=fit(final,data=train)

final_fit %>%
  extract_fit_engine() %>%
  rpart.plot()
```

```
## Warning: Cannot retrieve the data used to build the model (so cannot determine roundint and is.binary)
## To silence this warning:
##   Call rpart.plot with roundint=FALSE,
##   or rebuild the rpart model with model=TRUE.
```

Another Question5

```
spec=rand_forest(mtry = tune(),trees = tune(), min_n = tune()) %>%
  set_engine("ranger", importance = "impurity") %>%
  set_mode("classification")
```

```

wf=workflow() %>%
  add_model(spec) %>%
  add_recipe(rcp)

grid=grid_regular(mtry(range=c(1,8)),trees(range=c(1,10)),min_n(range=c(1,10)),levels=8)

grid

```

```

## # A tibble: 512 x 3
##   mtry trees min_n
##   <int> <int> <int>
## 1     1     1     1
## 2     2     1     1
## 3     3     1     1
## 4     4     1     1
## 5     5     1     1
## 6     6     1     1
## 7     7     1     1
## 8     8     1     1
## 9     1     2     1
## 10    2     2     1
## # ... with 502 more rows

```

mtry is the number of our selected predictors that we assign to each tree to make its decisions. trees is the number of trees we create in our forest. min\_n is the minimum number of data values needed to create further split.

mtry should not be smaller than 8 because it can't exceed the number of predictors in our grid, if so, there is no subset of the predictors that can be chosen. And mtry=0 means we don't have predictors at all, which doesn't make sense. mtry=8 represents all predictors we have will be randomly sampled.

Question6

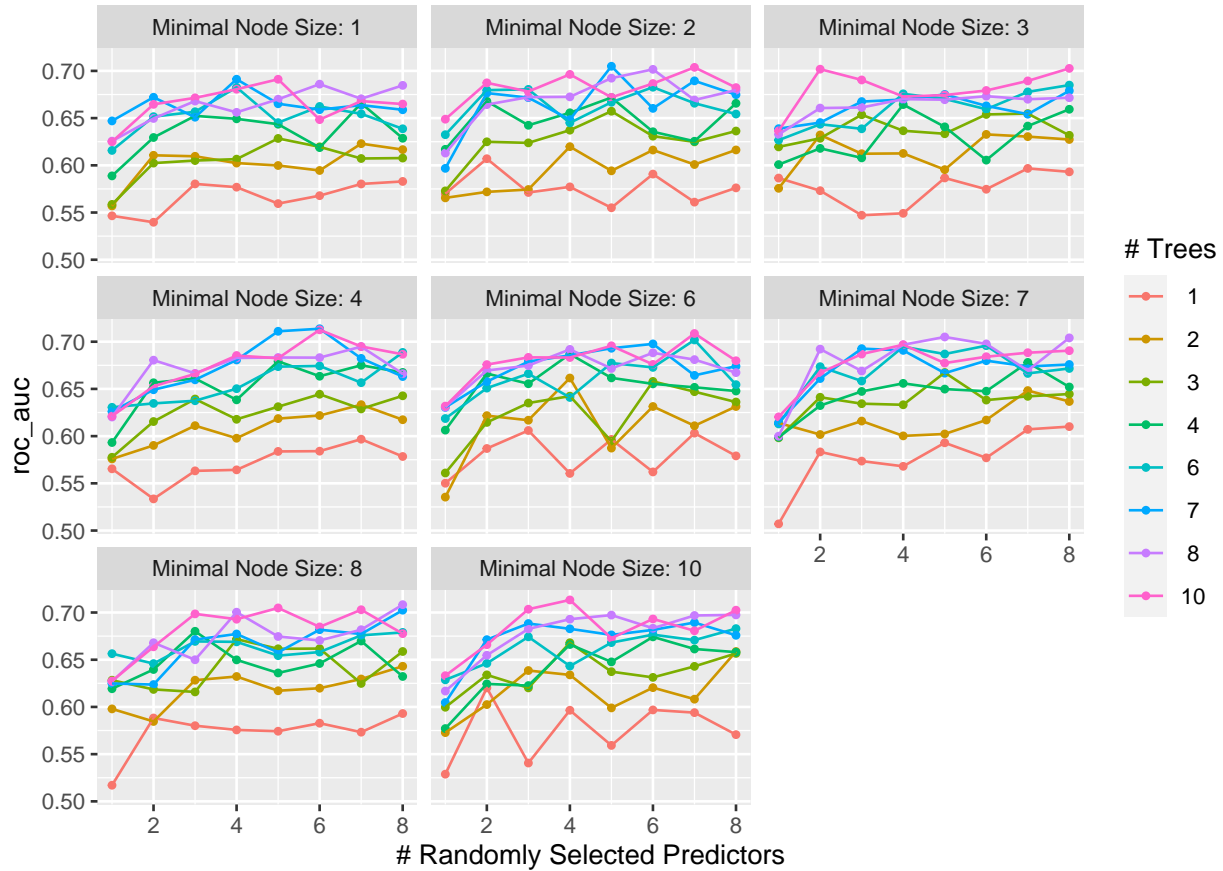

```

tune_res=tune_grid(
  wf,
  resamples=folds,
  grid=grid,
  metrics=metric_set(roc_auc)
)

autoplot(tune_res)

```

WE observe that the best performing models features 7, 8, or 10 trees. Minimal node size of 4 seemed to perform pretty good. Increasing the number of selected variables improves the performance. The number of selected should be at least 5 for the sake of performance.

Question7

```
collect_metrics(tune_res) %>%
  arrange(-mean)
```

```
## # A tibble: 512 x 9
##   mtry trees min_n .metric .estimator mean     n std_err .config
##   <int> <int> <int> <chr>   <chr>   <dbl> <int>   <dbl> <chr>
## 1     6     7     4 roc_auc hand_till 0.714     5 0.0215 Preprocessor1_Model~
## 2     4    10    10 roc_auc hand_till 0.713     5 0.0148 Preprocessor1_Model~
## 3     6    10     4 roc_auc hand_till 0.713     5 0.0127 Preprocessor1_Model~
## 4     5     7     4 roc_auc hand_till 0.711     5 0.00701 Preprocessor1_Model~
## 5     7    10     6 roc_auc hand_till 0.709     5 0.00458 Preprocessor1_Model~
## 6     8     8     8 roc_auc hand_till 0.708     5 0.0170 Preprocessor1_Model~
## 7     5     8     7 roc_auc hand_till 0.705     5 0.00908 Preprocessor1_Model~
## 8     5     7     2 roc_auc hand_till 0.705     5 0.0116 Preprocessor1_Model~
## 9     5    10     8 roc_auc hand_till 0.705     5 0.0177 Preprocessor1_Model~
## 10    8     8     7 roc_auc hand_till 0.704     5 0.0122 Preprocessor1_Model~
## # ... with 502 more rows
```

The roc\_auc of our best-performing pruned decision tree on the folds is 0.7137 in model 238.

Question8

```

best=select_best(tune_res)

final=finalize_workflow(wf,best)

final_fit=fit(final,data=train)

final_fit %>%
  extract_fit_engine() %>%
  vip()

```

The most useful variables are attack, hp, then sp\_atk. The least useful variables are generation\_X5, generation\_X4, generation\_X3, and generation\_X2. Although I know nothing about Pokemon, this makes sense to me.

#### Question 9

```

boosted_spec=boost_tree(trees=tune()) %>%
  set_engine("xgboost") %>%
  set_mode("classification")

boosted_wf=workflow() %>%
  add_recipe(rcp) %>%
  add_model(boosted_spec)

grid_boosted=grid_regular(trees(range=c(10,2000)),levels = 10)

```

```
tune_res_boosted=tune_grid(
  boosted_wf,
  resamples=folds,
  grid=grid_boosted,
  metrics=metric_set(roc_auc))

autoplot(tune_res_boosted)
```

We observe that there is a jump of roc\_auc from the 0-250 tree range, after which we get slowly decreasing roc\_auc.

```
collect_metrics(tune_res_boosted) %>%
  arrange(-mean)
```

```
## # A tibble: 10 x 7
##   trees .metric .estimator mean      n std_err .config
##   <int> <chr>   <chr>    <dbl> <int>  <dbl> <chr>
## 1   231 roc_auc hand_till  0.721     5  0.0105 Preprocessor1_Model102
## 2   673 roc_auc hand_till  0.720     5  0.00939 Preprocessor1_Model104
## 3   894 roc_auc hand_till  0.719     5  0.00971 Preprocessor1_Model105
## 4   452 roc_auc hand_till  0.719     5  0.00940 Preprocessor1_Model103
## 5  1336 roc_auc hand_till  0.719     5  0.00961 Preprocessor1_Model107
## 6  1115 roc_auc hand_till  0.719     5  0.00991 Preprocessor1_Model106
## 7  1557 roc_auc hand_till  0.718     5  0.00942 Preprocessor1_Model108
## 8  2000 roc_auc hand_till  0.718     5  0.00929 Preprocessor1_Model110
```

```
## 9 1778 roc_auc hand_till 0.717      5 0.00934 Preprocessor1_Model09
## 10 10 roc_auc hand_till 0.705      5 0.0137 Preprocessor1_Model01
```

The roc\_auc of our best-performing pruned decision tree on the folds is 0.721 in model 02.
